It's Two, Two LCDs In One!

November 7, 2003

The eponymously named Doublesight Corp. launched its first product this week, which combines two LCD monitors in one side-by-side display.

Designed for office work, casual browsing, or other applications where two monitors would be handy, the DoubleSign DS-1500 places two 15-inch LCDs side-by-side, each capable of up to 1024 x 768 resolution. The combination provides the user an effective workspace of 24 inches by 9 inches, all for \$799.

DoubleSight can be connected to computers with two VGA ports, one VGA port and a DVI port, or to two separate computers by attaching one VGA cable to each computer. Additionally, DoubleSight is powered through a single power cord providing a simplified cabling solution.

"With respect to recent technology advances in faster processors, larger storage, and quicker Internet connections, the monitor is the last remaining barrier to greater user productivity," said Jay Muskovich, chief executive officer of DoubleSight Displays, LLC, in a statement. "We have designed the DoubleSight dual LCD monitor to allow users to take better advantage of their data and computing power while increasing multitasking and productivity by as much as 50 percent. The combination of productivity gains and other cost savings can provide companies with a very quick return on their investment in a DoubleSight."

The company has provided product shots and additional specifications on its [web site](#).
